

## ABSTRACT OF DISCLOSURE

A common-mode choke coil including a first magnetic substrate 1, electrically insulating layers and coil pattern-including coil conductor layers 5 and 7 formed alternately on the first magnetic substrate 1, and a second magnetic substrate 13 for covering an uppermost one of the electrically insulating layers, wherein: central regions of the electrically insulating layers surrounded by the coil patterns and portions of the electrically insulating layers corresponding to outer circumferential regions of the coil patterns are removed; a magnetic powder-containing resin (magnetic layer 11) is provided on the uppermost one of the electrically insulating layers and embedded in the removed portions of the electrically insulating layers; and the second magnetic substrate 13 is bonded to a flattened surface of the magnetic powder-containing resin by an adhesive layer 12.
